New Scientific Discovery of Utmost Importance to Lawn Makers

Outstanding among the scientific discoveries in recent years is proof of the existence of plant hormones and their tremendous importance to plant growth. Extensive studies and experiments by scientists have shown that certain complex chemical substances exert upon the plants the same effect as the true plant hormones, the chemical nature of which still goes unsolved.

First applied for inducing root development on cuttings, their stimulating effect upon seed germination became evident soon after. During the course of such experiments a very decisive hormone influence on grass seeds was observed—a finding of utmost importance to all lawn makers.

Dreer's Lawn Grass Seeds are Hormone-Treated at No Increase in Price

Checking the results of our own experiments with those of other investigators we came to the conclusion that Dreer customers should have the immediate benefit from this sensational new discovery.

Be among the first to see for yourself just what Dreer's Hormone-Treated Lawn Grass Seed will do for you whether you start a new lawn or reseed the one you now have.

The Hormone Treatment of Dreer's Lawn Grass Seeds **induces quicker germination and more vigorous growth.** The effect is most marked upon the roots of the young plants and, as every gardener knows, an extensive, well developed root system is the foundation for a successful lawn able to withstand seasonable adversities and diseases.

Even with hormone treatment thorough soil preparation still is very important. Dreer's Hormone-Treated Lawn Grass Seed will make its best showing if sown in well-prepared, well-fertilized soil and given good care such as proper watering, etc.

Untreated

Treated plant has close to three times the root strength of untreated one.

40-365 A Superb Mixture of Garden Hyacinths

This special mixture of Bedding Hyacinths deserves the gardener's particular attention since their low price will permit everyone to secure a magnificent display of color in early spring. Though many gardeners still get great pleasure from planting Hyacinths in formal beds or borders there now is a strong trend for grouping a dozen bulbs or more here and there in the border where they give a special accent and fit in beautifully with the carefree natural arrangement of such borders. There is hardly a garden where several dozen of these mixed garden Hyacinths could not be used to great advantage.

Treasure Chest of **Hardy Flowering Bulbs** *That Bloom During Spring, Summer, & Fall*

Hardy bulbs bring to our gardens a wealth of colorful flowers. All of them are easy to grow and those which flower during the early spring are particularly welcome. Though they are small they are truly beautiful. Take for example the Snowdrops, Chionodoxa, or Crocus that greet us soon after the last of the snow has melted. Scillas and Grape Hyacinths continue the procession with Fritillaria, Lily of the Valley, Anemone, Calochortus, Erythronium, Leucojum, and Ranunculus providing a succession that leads up to the early summer-flowering plants. For blooming this fall plant Colchicum and Fall-Flowering Crocus without delay.

Glorious Bulbous IRIS

DUTCH, SPANISH, & ENGLISH

These Hardy Iris must be planted in the Fall

Iris will give your garden a maze of sparkling splendor—and is the garden really complete without these dainty touches of color?

These Iris differ from the Bearded and Japanese by producing bulbs instead of rhizomes. These must be planted in the fall, the earlier the better and they have proved quite hardy. Where winters are very severe they should be covered deeply with straw, hay, or leaves. Excepting the English Iris they form foliage in the fall with the leaves persisting throughout the winter. Cover the bulbs 4 to 6 inches deep.
